

WITS Local Installation & Deployment Guide

Step 1: Prepare Your Environment

1. Install **XAMPP** and start Apache & MySQL. 2. Inside your `htdocs` directory, create a folder named `loams\_api`. 3. Copy all your PHP files into this folder: - `student\_login.php` - `admin\_login.php` - `register\_student.php` - `upload\_students\_zip.php` - `bulk\_update\_students.php` - `db.php` 4. Inside `loams\_api`, create these subfolders: - `/uploads/` - `/uploads/students/` - `/uploads/temp/` 5. Give these folders write permissions (Full Control on Windows).

Step 2: Database Setup

1. Open phpMyAdmin → create a new database named `wits\_app`. 2. Import your `students.sql` file to populate tables. 3. Confirm tables exist: `students`, `library\_visits`, `admins`. 4. Edit your `db.php` file to use: `$conn = new mysqli("localhost", "root", "", "wits_app");`

Step 3: Configure the Desktop Application

1. Open your Qt project. 2. Update all PHP URLs to point to your local server:
`http://localhost/loams_api/student_login.php` `http://localhost/loams_api/register_student.php`
`http://localhost/loams_api/bulk_update_students.php` 3. Rebuild your app.

Step 4: Testing Your Setup

1. Start Apache and MySQL in XAMPP. 2. Run the WITS app. 3. Log in with a valid student ID — you should see their photo and info. 4. Try registering a student with a photo (stored in `/uploads/students/`). 5. Check the `wits\_app.students` table to confirm updates.

Step 5: Installing on Another Device

1. Install XAMPP on that computer. 2. Copy the `loams\_api` folder into its `htdocs` directory. 3. Import your `wits\_app` database. 4. In your app, change API URLs from `localhost` to your PC IP:
Example: `http://192.168.1.10/loams_api/student_login.php`

Step 6: Troubleshooting

- “Invalid file type” → Upload JPG, PNG, or GIF.
- “Failed to upload photo” → Fix folder permissions.
- “No data in app” → Check DB connection in `db.php`.
- “Charts not updating” → Verify data in `library\_visits`.

■ You're All Set!

Your WITS system should now run locally. To share it on your LAN, ensure Apache is allowed through the firewall and use your local IP.
